INTRODUCTION

This database was established in 1978 under the aegis of the Interagency Collaborative Group on Environmental Carcinogenesis, National Cancer Institute (NCI). The work is performed by the Health and Environmental Information Section, Public Information and Presentations, Science Applications International Corporation (SAIC), Oak Ridge, Tennessee, under the direction of the Exposure Evaluation Division, Office of Toxic Substances, U.S. Environmental Protection Agency (EPA). Funds are provided through interagency agreements involving NCI, EPA, and the U.S. Department of Energy (DOE), and a contract between DOE and SAIC. The database provides a central source of systematically collected and organised body-burden data that facilitates the early identification of actual or potential human exposure to environmental contaminants and the assessment of the significance of such exposure.

Data are obtained primarily through routine, manual searches of selected, scientific journals. These searches are augmented by searches of computerized databases. Because the database is not intended to obviate the need for the user to refer ultimately to the original sources, no attempt is made to evaluate the quality of the data. Information on chemical nomenclature and properties is from online sources and standard handbooks.

The database is used in exposure, hazard, and risk assessment; in identifying potential human and environmental health problems, including sources of exposure to toxic substances; in planning research and comparing results; and in teaching in public health and medical schools.

The database is available online through Lockheed's DIALOG Information Services, Inc. (File 138) and to DOE and DOE contractors through RECON (File 38). Hard copies are printed and distributed annually, primarily to interested government agency administrators and scientists, selected government agency libraries, and medical and public health school libraries. A companion report, Chemicals Identified in Feral and Food Animals, is also available. Individuals not having access to library copies or needing personal copies, may obtain them from the National Technical Information Service, U.S. Department of Commerce, 5285 Port Royal Road, Springfield, VA 22161. A limited number of copies is available on request to M. Virginia Cone, Science Applications International Corporation, 300 S. Tulane Avenue, Oak Ridge, TN 37830.

Comments by users of the database are invited. Correspondence should be directed to:

USER'S GUIDE

In this 1984 annual publication, Part 1 contains introductory materials, chemical and journal lists, and indices. In Part 2 are found, in tabular form, records on nondrugs added since the last publication, and in Part 3, records on drugs.

Appropriate data are extracted from journal articles and entered in the database by chemical and tissue/body fluid. Each such data entry is a single record and is given a record number. (Record numbers are assigned consecutively throughout the entire database). If a particular document contains information on more than one chemical and/or tissue, there will be multiple records. For example, a study of 5 chemicals in each of 3 tissues has 15 different records in the database and 15 record numbers. Chemicals in each part are arranged alphabetically by Chemical Abstracts Service (CAS) preferred name.

Samples of two records are used to illustrate the format of the table. The chemical, in these examples, Lead, is listed first, followed by its CAS Registry number, symbol or formula, and chemical properties. These data are repeated at the top of each new page containing continued data on the same chemical. Keywords and references for each record appear across the columns at the bottom of the record. If there are multiple, records from the same source, keywords/references appear with the last record in the set. The tissue and the record number are given in the first column, and numbers of cases and exposure route, ranges and means of concentrations found in the tissue are reported in the next three columns.

Exponents are written as in the following example: 5×10^{-15} is 5 x 10(E-15). All means are arithmetic unless designated geometric. When included, standard error is indicated by S.E. However, standard deviations, when given, have no such designations. When source documents display data graphically, values are estimated by the data extractors and so indicated under general information.

Keywords provide additional information about the study reported and the contents of the source document. For example, another tissue occurring as a keyword indicates that the document also contains information on that tissue.

Secondary sources such as review articles are included; however, specific data (range, mean, etc.) are not recorded. Reviews are designated in the general information column.

CAS preferred names are from the Ninth Collective Index, and, when different, names from both eighth and ninth indices (8 CI, 9CI) are given. An alphabetical list of paired with CAS preferred names is provided in the Chemical Lists section of Part 1. For accessing information in the database when only the CAS Registry number is known, the user should refer to the list (also in Part 1) of CAS Registry numbers coupled with preferred names. Author, tissue or body fluid, and keyword indices in Part 1 refer the user to the appropriate record number(s) in Parts 2 and 3. A cumulative chemical index for the entire database (1979-1984) is also included.

16. Abstract (Limit: 200 words)

The database provides a central source of systematically collected and organized body-burden data that facilitates the early identification of actual or potential human exposure to environmental contaminants and the assessment of the significance of such exposure. Data included are obtained through routine manual searches of selected scientific journals, augmented by computer searches.

The database, which includes the separately published files, Chemicals Identified in Human Biological Media and Chemicals Identified in Feral and Food Animals, contains information on more than 1600 chemicals. The database is used in exposure, hazard and risk assessment; identifying potential human and environmental health problems including sources of contamination; planning research and comparing results; and in teaching at medical and public health schools.

The database is under the aegis of the Interagency Collaborative Group on Environmental Carcinogenesis, National Cancer Institute (NCI) and is maintained by the Health and Environmental Information Section, Science Applications International Corporation under the direction of the Exposure Evaluation Division, U.S. Environmental Protection Agency (EPA). Funding is provided through interagency agreements involving NCI, EPA, and the U.S. Department of Energy.
